

Data treatment

Trials with implausibly quick RTs (<200 ms) or exceptionally slow RTs (>10000 ms) or with no recorded response were omitted (6.88% of trials among included participants). Participants missing a session, with more than 2 window–exit events in a session, more than 40% of a session's trials excluded, or 3 or more quiz questions requiring a retry in a session, in total 2 participants (18.2% of subjects), were excluded altogether. The final sample consisted of 9 participants (age mean, 38.2; range, 22 to 58; 6 males, 3 females). This resulted in an average of 97.8 trials per participant (SD = 8.7), with the number of trials ranging from 75 to 105 across subjects.
