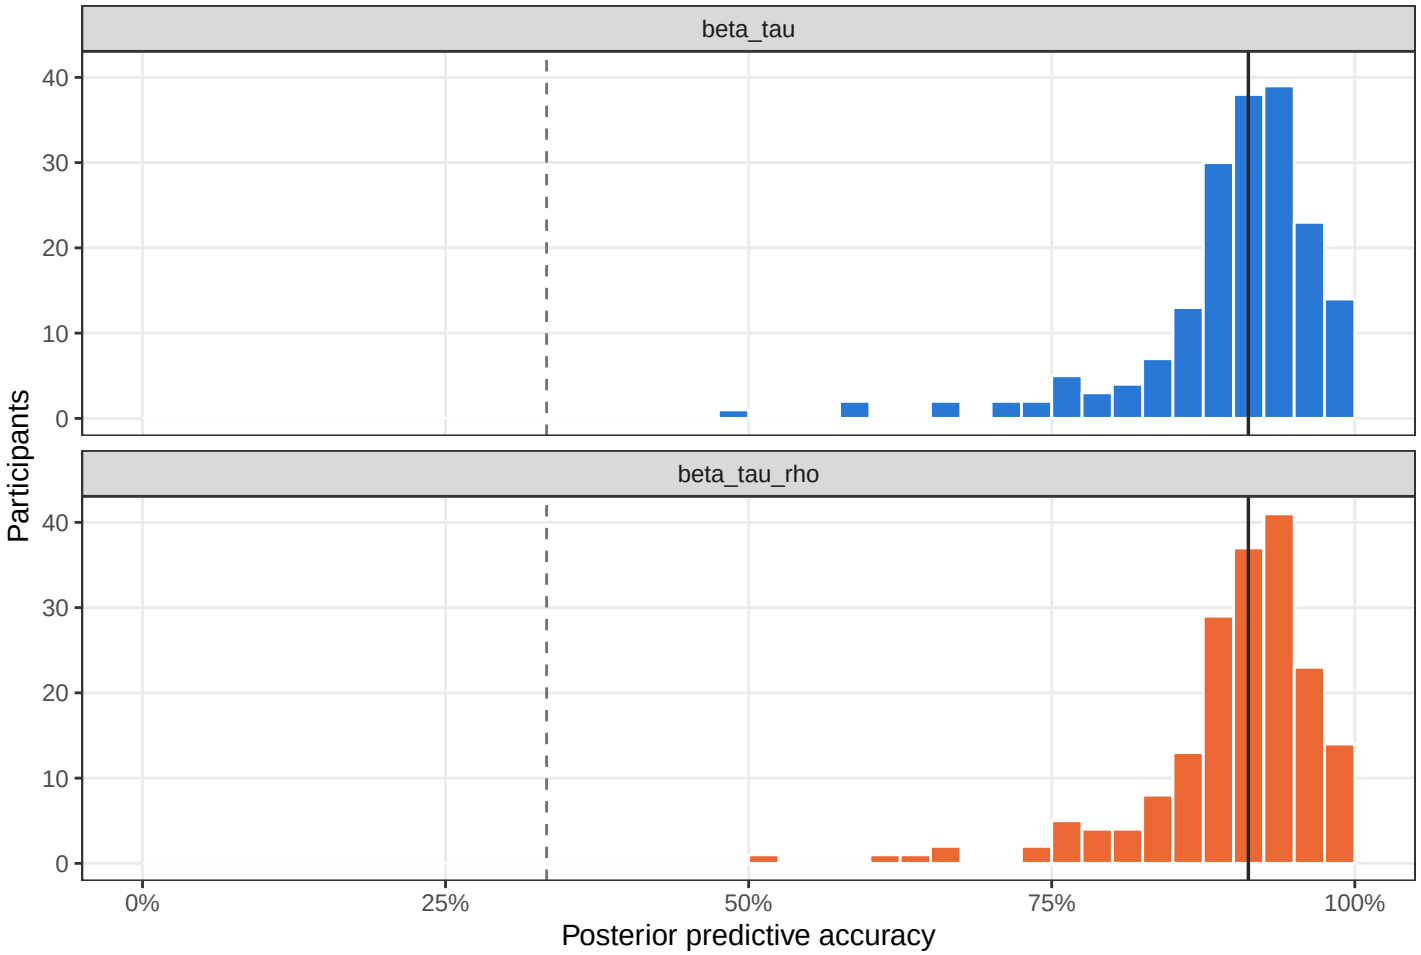
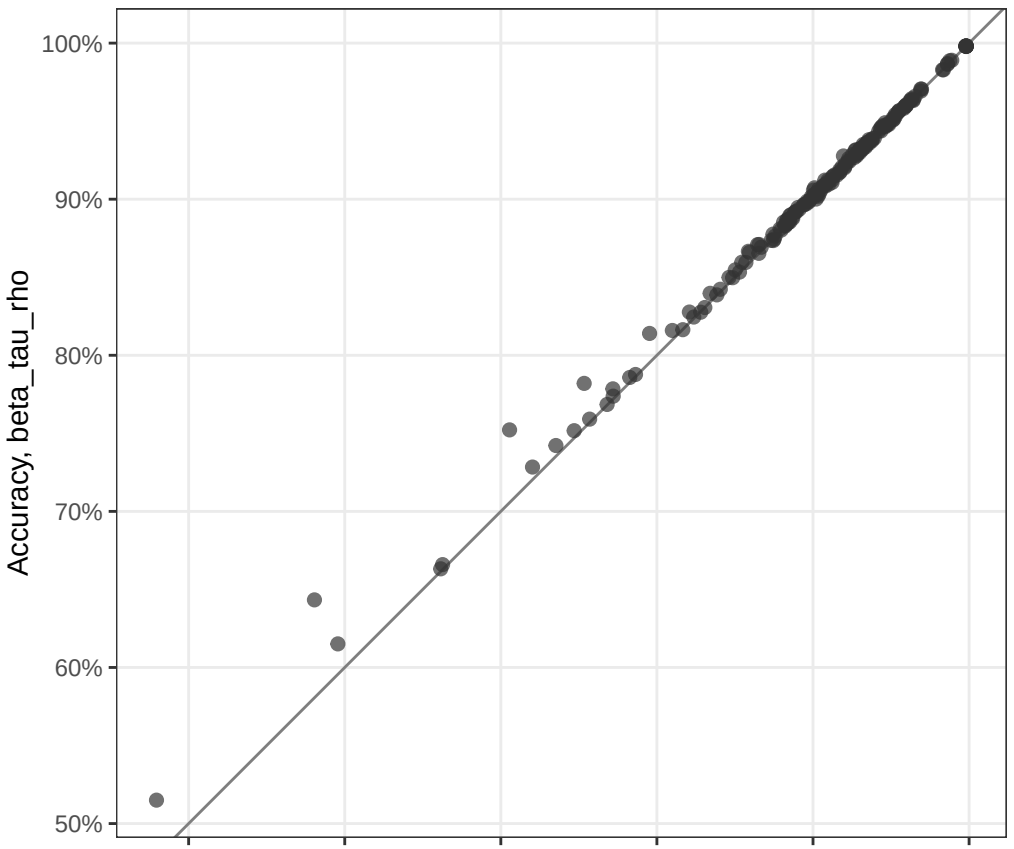
A. Posterior predictive accuracy per participant

Solid line: median participant. Dashed: chance (1/3).



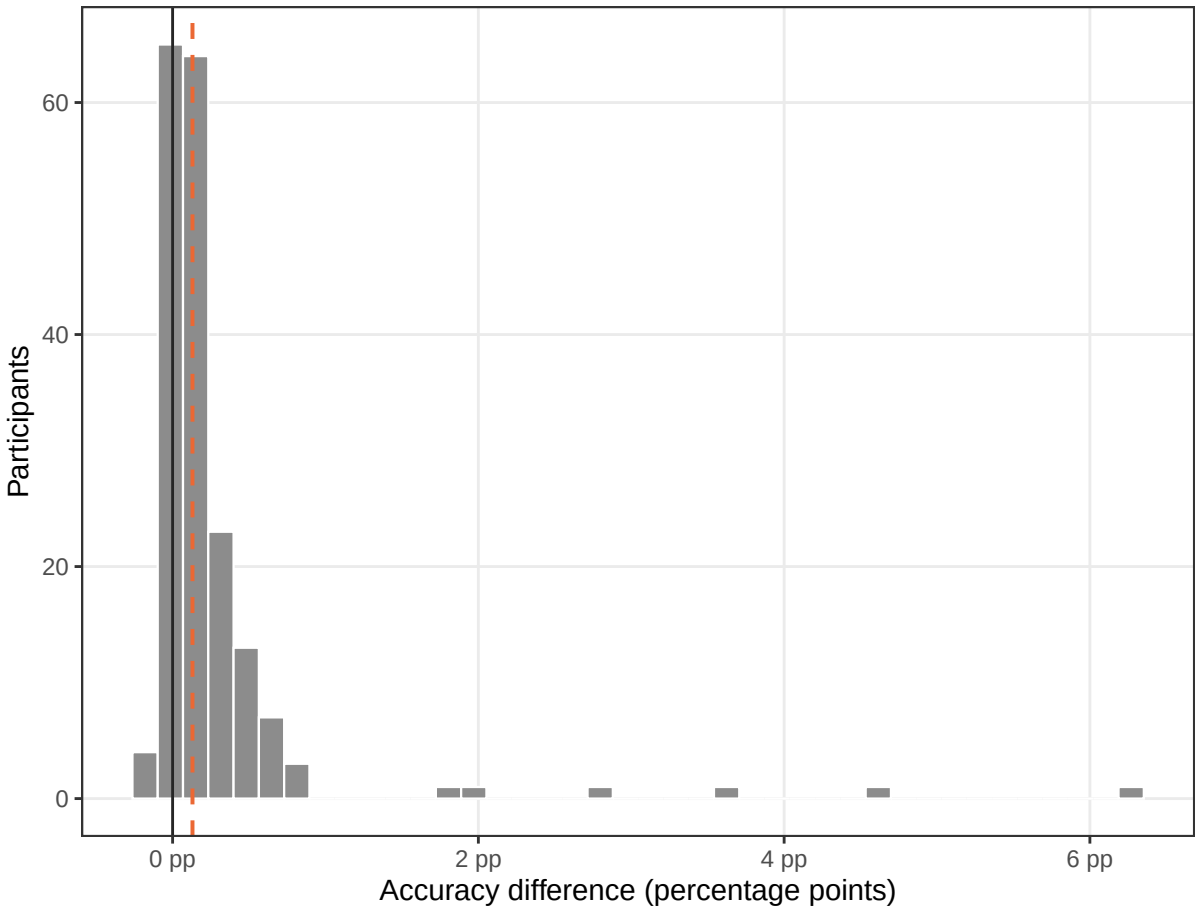
B. Same participant, two models

Above the line: beta_tau_rho predicts better



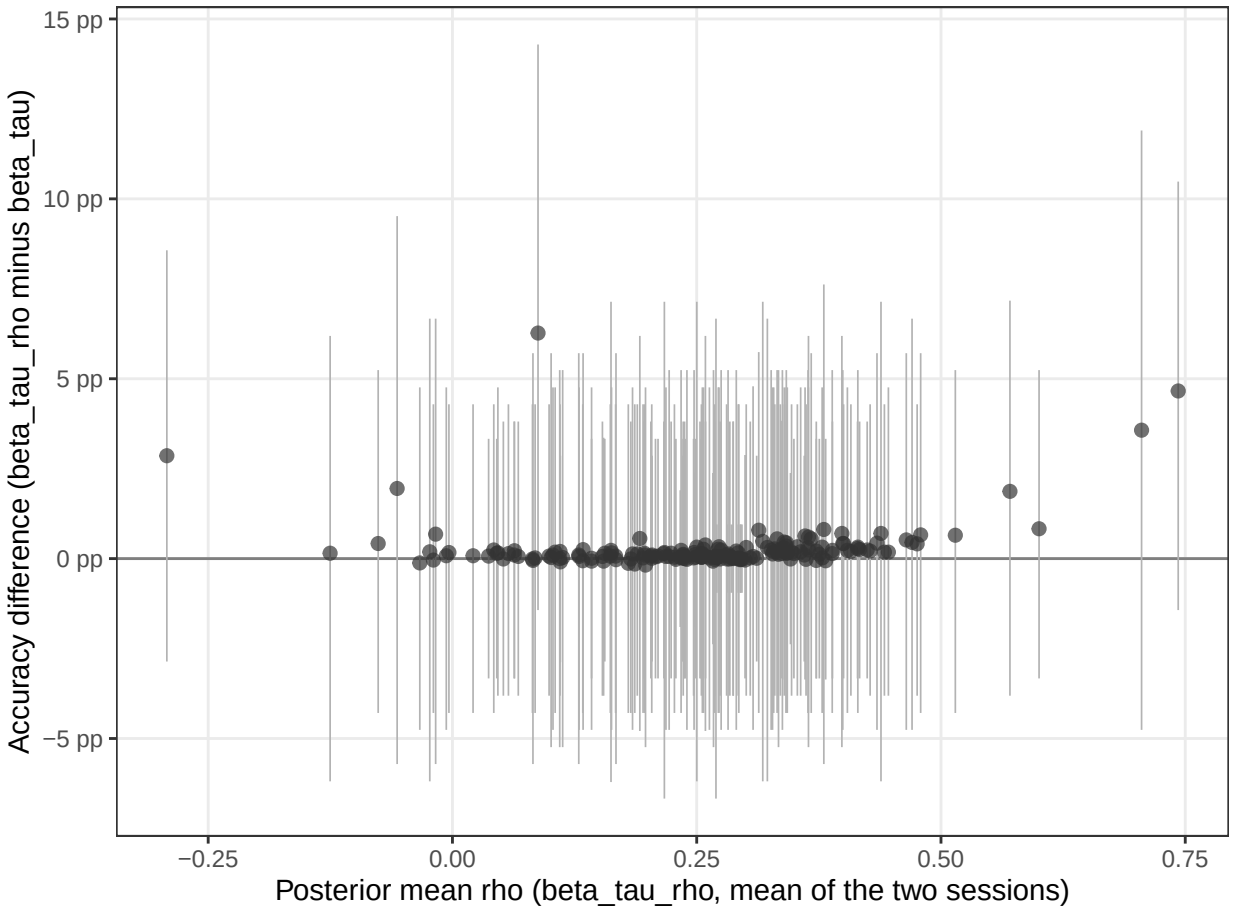
C. Difference in accuracy (beta_tau_rho minus beta_tau)

Dashed: median participant (+0.1 pp). Higher for beta_tau_rho in 152 of 185 participants.



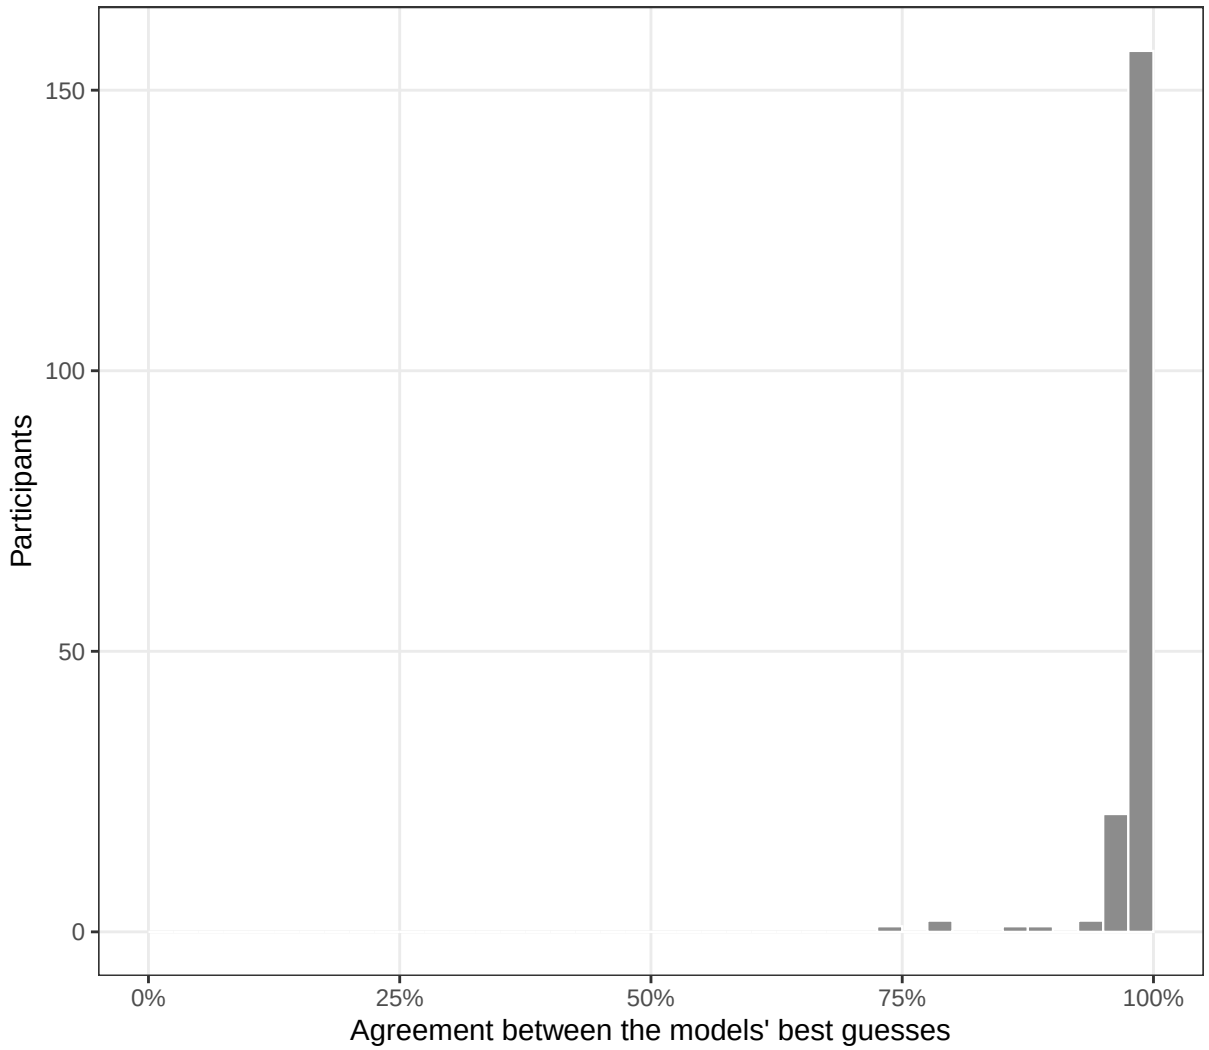
D. Accuracy gain against the participant's rho

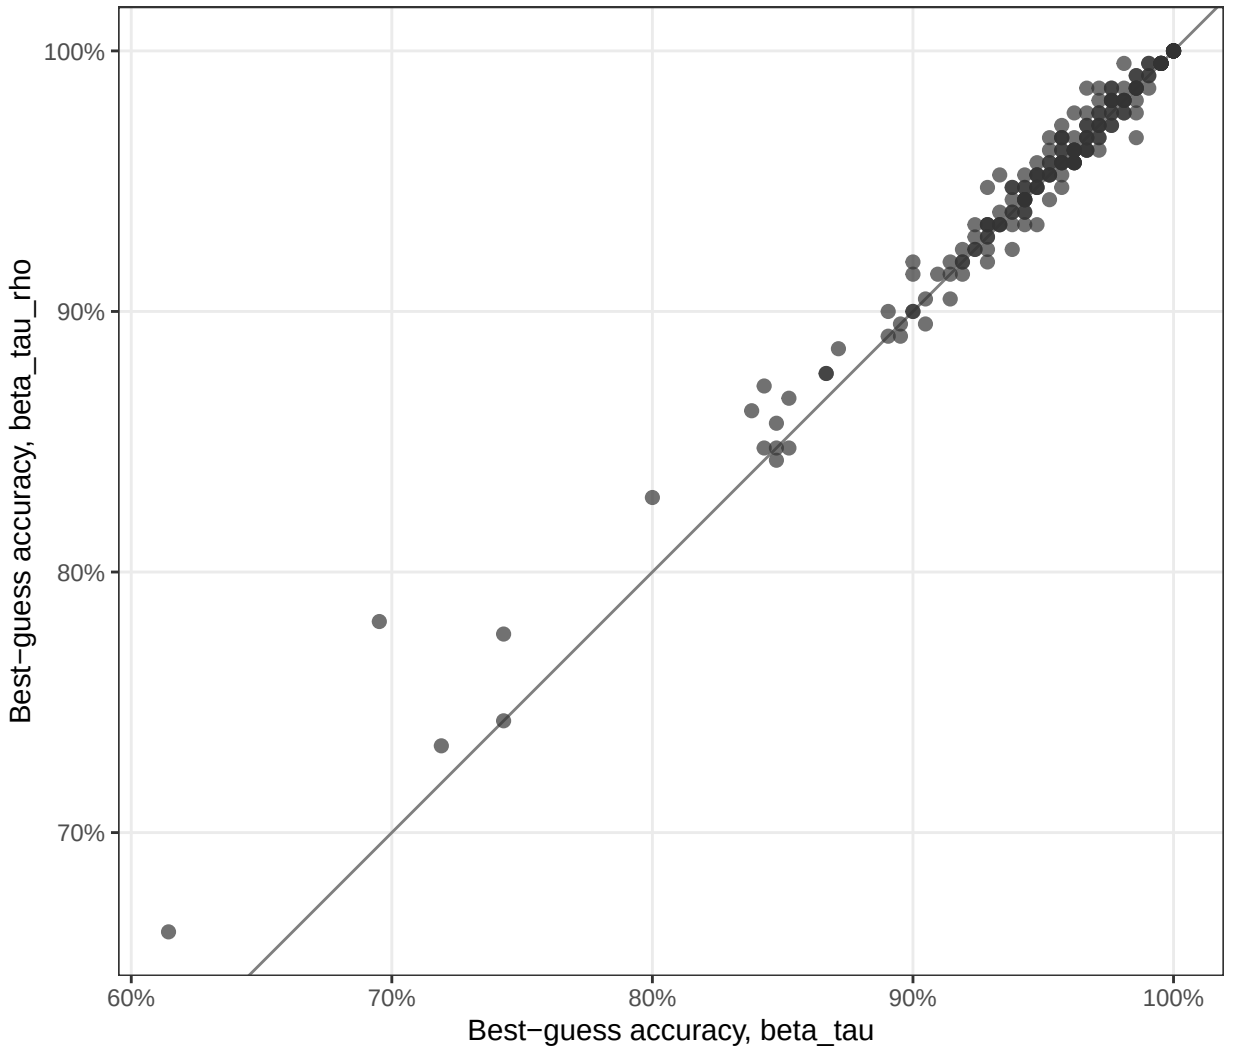
Point: mean difference. Line: 90% interval over draws.



How differently the two models predict

Share of trials on which both models' most probable response is the same (mean 98.4%)





Best−guess accuracy, same participant, two models
